

CONGRUENT ZETA FUNCTIONS. NO.12

YOSHIFUMI TSUCHIMOTO

Let X be an affine algebraic curve, \bar{X} its compactification.

The algebra $A = \mathcal{O}_x(X)$ carries the information we need to consult X . (In deed, we have $X = \text{Spec } A$.) The Laurent expansion $A \subset \bigoplus_j \mathbb{C}((X_j))$ gives an embedding in a way such that A is a "half dimensional" vector subspace of $\bigoplus_j \mathbb{C}((X_j))$. In other way, the embedding gives a point on a "Grassmann manifold." The coordinate of the Grassmann manifold, given by Plücker coordinate, is related to the "theta function" of X .
